LaBRI - 7 Novembre 2017

Formalization of biological problems into general computer science problems

- help with **automated reasoning** on biological knowledge/models
- **challenging**: bring classes of difficult problems
⇒ **motivation for new** theoretical/technical **developments**
- try to **attract formal computer scientists**

Biological processes

Numerous modelling approaches

- **Structure** of molecules (RNA, DNA, proteins)
⇒ predict dockings, change of conformation/function, ...
- **Quantitative** models (ODEs, stochastic population models, ...)
⇒ track evolution of concentrations/copy number of molecules
⇒ requires a huge amount of precise parameters
- **Qualitative** models (Boolean networks, threshold networks, ...)
⇒ focus on causal processes
⇒ abstract/generic view of the system, requires few parameters
- Multi-cellular spatial models, organs, individuals, ecology, ...

No “true” model, each modelling approach is justified on its own.

Signalling and gene networks

Prediction

- Cell response w.r.t. signal+environment
- Long-term behaviours (differentiation)

Control

- Mutations/Perturbations for modifying cell behaviour
- Trans/De-differentiation

Computational models of biological networks

Network: account for **indirect influences** between **entities** of a system

[Naldi et al, PLOS Comput Biol 2010]

Computational models of biological networks

Network: account for **indirect influences** between **entities** of a system

A biological model is typically built from

- literature (tedious)
- (curated) **databases**: pull interactions discovered in very different experimental settings
- **network inference** from data: prune networks to fit with data; identify new interactions
- **expert knowledge** (people)

[Naldi et al, PLOS Comput Biol 2010]

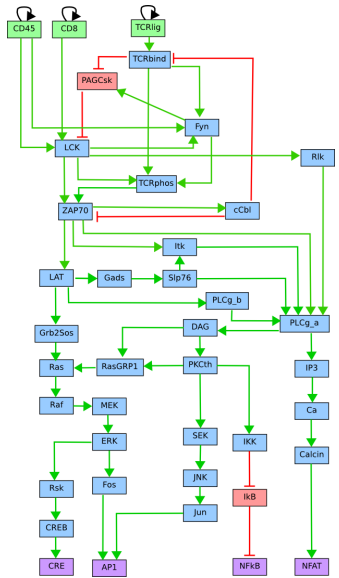

Computational models of biological networks

Network: account for **indirect influences** between **entities** of a system

A biological model is typically built from

Semantics of Boolean networks

Definition (Boolean network)

$f = \langle f_1, \dots, f_n \rangle$ with $f_i : \{0, 1\}^n \rightarrow \{0, 1\}$

Example:

$$f_1(x) = 0$$

$$f_2(x) = x_1 \wedge \neg x_2$$

$$f_3(x) = \neg x_2 \wedge (x_1 \vee x_3)$$

Definition (Asynchronous transition)

Irreflexive relation $\rightarrow \subseteq \{0, 1\}^n \times \{0, 1\}^n$ such that

$$x \rightarrow y \iff \Delta(x, y) = \{i\} \wedge y_i = f_i(x)$$

where $\Delta(x, y) = \{i \in \{1, \dots, n\} \mid x_i \neq y_i\}$

(non-deterministic semantics)

Example

Influence graph (knowledge)

Boolean network

$$f_1(x) = 0$$

$$f_2(x) = x_1 \wedge \neg x_2$$

$$f_3(x) = \neg x_2 \wedge (x_1 \vee x_3)$$

State transition graph with asynchronous updating mode

 $\langle 1, 0, 0 \rangle$

[René Thomas in Journal of Theoretical Biology, 1973] [A. Richard, J.-P. Comet, G. Bernot in Modern Formal Methods and Applications, 2006]

Example

Influence graph (knowledge)

Boolean network

$$f_1(x) = 0$$

$$f_2(x) = x_1 \wedge \neg x_2$$

$$f_3(x) = \neg x_2 \wedge (x_1 \vee x_3)$$

State transition graph with asynchronous updating mode

[René Thomas in Journal of Theoretical Biology, 1973] [A. Richard, J.-P. Comet, G. Bernot in Modern Formal Methods and Applications, 2006]

Example

Influence graph (knowledge)

Boolean network

$$f_1(x) = 0$$

$$f_2(x) = x_1 \wedge \neg x_2$$

$$f_3(x) = \neg x_2 \wedge (x_1 \vee x_3)$$

State transition graph with asynchronous updating mode

[René Thomas in Journal of Theoretical Biology, 1973] [A. Richard, J.-P. Comet, G. Bernot in Modern Formal Methods and Applications, 2006]

Example

Influence graph (knowledge)

Boolean network

$$f_1(x) = 0$$

$$f_2(x) = x_1 \wedge \neg x_2$$

$$f_3(x) = \neg x_2 \wedge (x_1 \vee x_3)$$

State transition graph with asynchronous updating mode

[René Thomas in Journal of Theoretical Biology, 1973] [A. Richard, J.-P. Comet, G. Bernot in Modern Formal Methods and Applications, 2006]

Example

Influence graph (knowledge)

Boolean network

$$f_1(x) = 0$$

$$f_2(x) = x_1 \wedge \neg x_2$$

$$f_3(x) = \neg x_2 \wedge (x_1 \vee x_3)$$

State transition graph with asynchronous updating mode

[René Thomas in Journal of Theoretical Biology, 1973] [A. Richard, J.-P. Comet, G. Bernot in Modern Formal Methods and Applications, 2006]

Example

Influence graph (knowledge)

Boolean network

$$f_1(x) = 0$$

$$f_2(x) = x_1 \wedge \neg x_2$$

$$f_3(x) = \neg x_2 \wedge (x_1 \vee x_3)$$

State transition graph with asynchronous updating mode

[René Thomas in Journal of Theoretical Biology, 1973] [A. Richard, J.-P. Comet, G. Bernot in Modern Formal Methods and Applications, 2006]

Properties of interest

- **Fixpoints:** $f(x) = x$
- **Attractors:** smallest set of states closed by \rightarrow (terminal strongly connected components)
- **Reachability:** there is a path from x to y

Tractability issues

Model validation (model checking)

- **Combinatorial explosion** of behaviours
networks with 100 to 1,000 nodes: $2^{100} - 10^{30}$ to $2^{1000} - 10^{300}$ states
- BDDs/BMC/. . . have a hard time on biological networks. . .
- Difficult to extract **comprehensive proofs** of (im)possibility.

(Reachability is PSPACE-complete)

Tractability issues

Model validation (model checking)

- **Combinatorial explosion** of behaviours
networks with 100 to 1,000 nodes: $2^{100} - 10^{30}$ to $2^{1000} - 10^{300}$ states
- BDDs/BMC/. . . have a hard time on biological networks. . .
- Difficult to extract **comprehensive proofs** of (im)possibility.

(Reachability is PSPACE-complete)

Prediction for control (e.g., perturbations to prevent/enforce behaviour)

- Model checking complexity
- + too many candidates for brute-force screening \Rightarrow **deduction**/abduction

Tractability issues

Model validation (model checking)

- **Combinatorial explosion** of behaviours
networks with 100 to 1,000 nodes: $2^{100} - 10^{30}$ to $2^{1000} - 10^{300}$ states
- BDDs/BMC/... have a hard time on biological networks...
- Difficult to extract **comprehensive proofs** of (im)possibility.

(Reachability is PSPACE-complete)

Prediction for control (e.g., perturbations to prevent/enforce behaviour)

- Model checking complexity
- + too many candidates for brute-force screening \Rightarrow **deduction**/abduction

Network inference (find Boolean networks satisfying reachability constraints)

- Combinatorial explosion of model parameters
- Data involve time series: reachability checking complexity..

Outline

- 1 Computational models for biological processes

Abstractions for transient dynamics of Boolean Networks

Intuition: exploit the **low scope of transitions** (concurrency)

- Static analysis by **abstract interpretation** [Cousot and Cousot 77]
- Intermediate representation (**Local Causality Graph**) to reason on necessary/sufficient conditions for transitions
- Implementation mixes algorithms on graphs and SAT (ASP).

Basically:

Approx. of PSPACE problems with $P.e^d$ or $NP.e^d$ problems

where d is the in-degree of nodes in the Boolean network

Transition Prime Implicants

Consider a Boolean network f where

$$f_1(x) = x_2$$

there exists 2^{n-2} transitions of the form

$$01x_2 \cdots x_n \rightarrow 11x_2 \cdots x_n$$

Transition Prime Implicants

Consider a Boolean network f where

$$f_1(x) = x_2$$

there exists 2^{n-2} transitions of the form

$$01x_2 \cdots x_n \rightarrow 11x_2 \cdots x_n$$

Prime implicants of transitions

- Express the **minimal cause** of a node value change $v_j : a \rightsquigarrow b$

Definition

C is a prime implicants for a node value change $v_j : a \rightsquigarrow b$ iff its a conjunction of literals of the form $[v_j = d]$ such that

$$[v_j = a \wedge C] \text{ is a prime implicant of } [f_j(v) = b]$$

We write it $\langle v_j : a \rightsquigarrow b, C \rangle$

In our case, only one transition prime implicant for $v_1 : 0 \rightsquigarrow 1$:

$$\langle v_1 : 0 \rightsquigarrow 1, [v_2 = 1] \rangle$$

Transitions Prime Implicants

Illustration

$$f_1(x) = x_2 \vee x_3$$

Implicants for the transition $\langle 011 \rangle \rightarrow \langle 111 \rangle$

Transitions Prime Implicants

Illustration

$$f_1(x) = x_2 \vee x_3$$

Implicants for the transition $\langle 011 \rangle \rightarrow \langle 111 \rangle$

Transitions Prime Implicants

Illustration

$$f_1(x) = x_2 \vee x_3$$

Implicants for the transition $\langle 011 \rangle \rightarrow \langle 111 \rangle$

Transitions Prime Implicants

Illustration

$$f_1(x) = x_2 \vee x_3$$

Implicants for the transition $\langle 011 \rangle \rightarrow \langle 111 \rangle$

\Rightarrow 2 prime implicants: $\langle v_1 : 0 \rightsquigarrow 1, [v_2 = 1] \rangle$; $\langle v_1 : 0 \rightsquigarrow 1, [v_3 = 1] \rangle$

Transitions Prime Implicants

Illustration

$$f_1(x) = x_2 \vee x_3$$

Implicants for the transition $\langle 011 \rangle \rightarrow \langle 111 \rangle$

\Rightarrow 2 prime implicants: $\langle v_1 : 0 \rightsquigarrow 1, [v_2 = 1] \rangle$; $\langle v_1 : 0 \rightsquigarrow 1, [v_3 = 1] \rangle$

Implicants for the transition $\langle 100 \rangle \rightarrow \langle 000 \rangle$

Transitions Prime Implicants

Illustration

$$f_1(x) = x_2 \vee x_3$$

Implicants for the transition $\langle 011 \rangle \rightarrow \langle 111 \rangle$

\Rightarrow 2 prime implicants: $\langle v_1 : 0 \rightsquigarrow 1, [v_2 = 1] \rangle$; $\langle v_1 : 0 \rightsquigarrow 1, [v_3 = 1] \rangle$

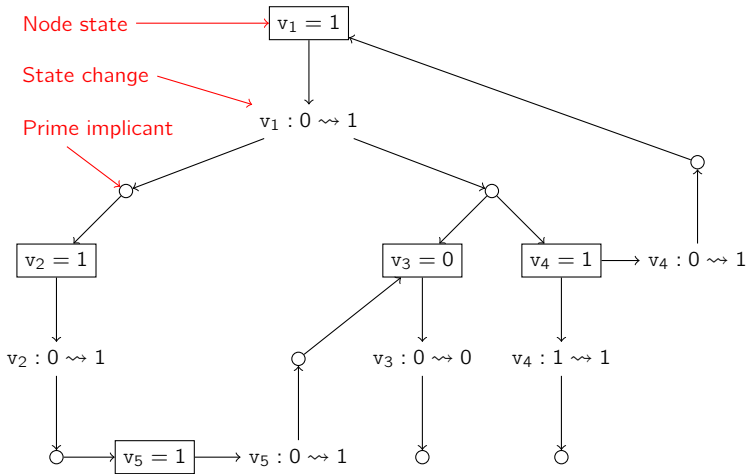

Implicants for the transition $\langle 100 \rangle \rightarrow \langle 000 \rangle$

\Rightarrow 1 prime implicant: $\langle v_1 : 1 \rightsquigarrow 0, [v_2 = 0 \wedge v_3 = 0] \rangle$

Local Causality Graph (LCG)

- Initial state $\langle 00010 \rangle$; Goal $[v_1 = 1]$

Local Causality Graph (LCG)

- Initial state $\langle 00010 \rangle$; Goal $[v_1 = 1]$

**Necessary condition for reachability**

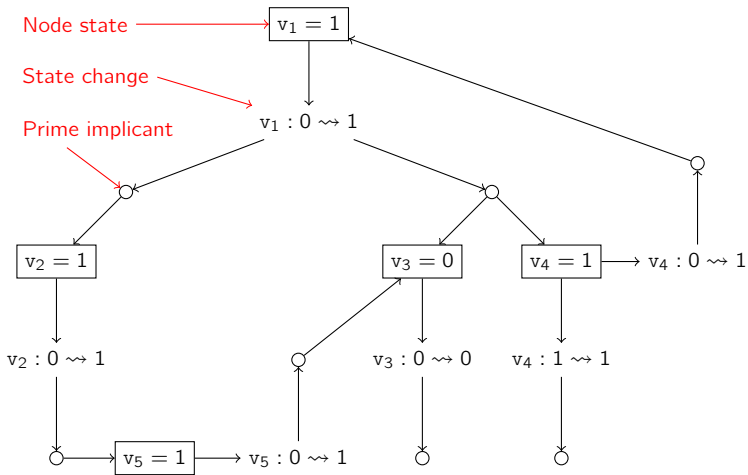

$OA(x \rightarrow^* [v_1 = 1]) \equiv$ there is an acyclic traversal from $v_1 = 1$ s.t.

- $v_2 : 0$ node state change \rightarrow follow at least one child;
- other nodes \rightarrow follow all children;
- terminates on empty "local cause" (leafs).

(can be verified linearly in the size of the LCG).

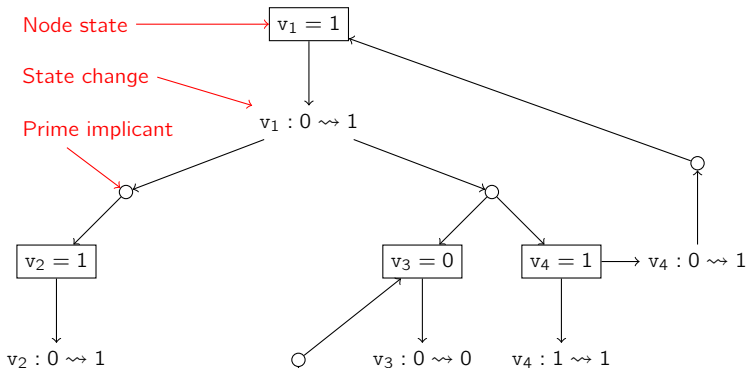

Local Causality Graph (LCG)

- Initial state $\langle 00010 \rangle$; Goal $[v_1 = 1]$

Local Causality Graph (LCG)

- Initial state $\langle 00010 \rangle$; Goal $[v_1 = 1]$

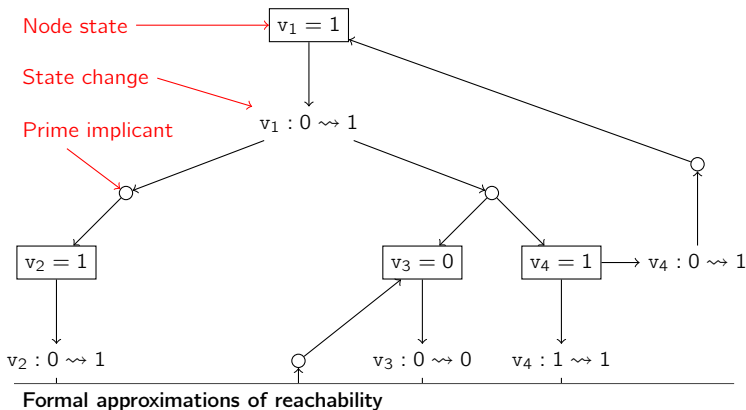

Sufficient condition for reachability

$UA(x \rightarrow^* [v_1 = 1]) \equiv \exists$ particular acyclic sub-LCG

NP formulation (find the right combination of prime implicants).

Local Causality Graph (LCG)

- Initial state $\langle 00010 \rangle$; Goal $[v_1 = 1]$

$$\text{UA}(x \rightarrow^* [v_1 = 1]) \Rightarrow x \rightarrow^* [v_1 = 1] \Rightarrow \text{OA}(x \rightarrow^* [v_1 = 1])$$

Applications

Applications

Common features (markers) of all trajectories (necessary steps)

Under-approximation:

$$a_i, b_j, \dots : \text{disable}(a_i, b_j, \dots) \wedge \neg \text{OA}(s \rightarrow^* g)$$

Applications

Control of reachability

Under-approximation:

$$a_i, b_j, \dots : \text{lock}(a_i, b_j, \dots) \wedge \neg \text{OA}(s \rightarrow^* g)$$

Applications

Key transitions responsible for capability loss (differentiation)

Under-approximation:

$$s_b, t_b : \text{UA}(s \rightarrow^* s_b) \wedge \text{UA}(s_b \rightarrow^* g) \wedge \neg \text{OA}(s_b \cdot t_b \rightarrow^* g)$$

Formal Approximations

Reachability [LP, M Magnin, O Roux in MSCS 2012; M Folschette, LP, M Magnin, O Roux in TCS 2015]

- Over-approximation (necessary condition): $OA(s \rightarrow^* g)$
P w/ # prime implicants
- Under-approximation (sufficient condition): $UA(s \rightarrow^* g)$
NP w/ # prime implicants

(# prime implicants: e^d in general; $\binom{d}{d/2}$ monotonous functions; much less in practice)

Cut-sets [LP, G Andrieux, H Koepl at CAV 2013]

- UA: a_i, b_j, \dots : $\text{disable}(a_i, b_j, \dots) \wedge \neg OA(s \rightarrow^* g)$

Mutations for blocking g [LP at CMSB 2017]

- UA: a_i, b_j, \dots : $\text{lock}(a_i, b_j, \dots) \wedge \neg OA(s \rightarrow^* g)$

Bifurcations [L F Fitime, C Guziolowski, O Roux, LP in BMC Algorithms for Mol Bio, 2017]

- UA: s_b, t_b : $UA(s \rightarrow^* s_b) \wedge UA(s_b \rightarrow^* g) \wedge \neg OA(s_b \cdot t_b \rightarrow^* g)$

In practice

Software **Pint** - [Static analyzer for dynamics of automata networks](#)

<http://loicpauleve.name/pint> [CMSB 2017]

- Input: Boolean/discrete networks; automata networks; 1-bounded Petri nets
- [Answer-Set Programming](#) implementation for solution enumeration (clingo)
- [Scalable](#) to networks between 100 to 10,000 nodes

Tutorial on <http://tmpnb.loicpauleve.name>

BUT

In systems biology

- Need for global networks, but lack of precise knowledge
- \Rightarrow Boolean networks are more and more popular
- Success stories start to come out

Computational methods allow to address larger and larger networks;
quite [soon at genome scale](#)...

BUT

Major remaining challenge: [deal with huge number of candidate models](#)

- network inference lead to many networks, equivalent w.r.t. available data
- most methods take as input a single model...
- how to make convincing predictions? (model counting...)
